Frontend exercise

09.04.2020

Overview

This image resembles a basic website. You will need basic understanding of HTML and CSS in order to achieve this.

Goals

1. Replicate the website

Specifications

The replica must be as exact as possible, with the correct color and images.

You're only allowed to use HTML,CSS and JS, you cannot use any Framework or libraries.

Milestones are specifications that will be added in the near future.

Milestones

I. Start script

The project must have a system that allows him to build it and run it.

II. Testing

You must implement unit and integration testing to your code.

Testing Specifications

For the testing, you need to add some logic to your project.

Starting with the buttons, all the buttons need to have:

- Whenever I pressed one, you should show in console the next message " Id: ${id} , Count: ${count} "
- You need to send an event the doesn't propagate to the father called " composed " and show this message on the console " I'm not propagating "
- You need to send an event to change the color of the other buttons (If you press the navbar, you change the ones on the footer and vice versa)

You need to add all the pertinent testing
